**Amendments to Specification**

Please make the following amendments to the specification

Paragraph on Page 3, Lines 25-27

-Figure 3 is a perspective ~~sectional~~ view that represents a variant of the improvement illustrated in Figure 2.

Paragraph on Page 4, Lines 13-17

Similarly, the ~~first~~ second disk shaped part 52 is installed in a cylindrical hole 58 that passes through the load bearing structure 54 along a second axis A2, such that the second part 52 can rotate freely about this second axis.

Paragraph on Page 5, Lines 16-23

Figure 2 illustrates a variant of the embodiment illustrated in Figure 1, in which the suspended structure 36 is in the form of a U-shaped clevis. More precisely, the suspended structure 36 illustrated in Figure 2 comprises two flat plates [[70]] 70' parallel to each other. In this case, a cylindrical hole 56 is machined in each of the plates [[70]] 70', such that the two holes 56 are centered on the same hinge pin A1.

Paragraph on Page 5, Lines 28-31 to Page 6, Lines 1-2

In this case, the tab materializing the load bearing structure 54 is placed between the parallel plates [[70]] 70' of the suspended structure 36, with the disk shaped part 52 that fits free to rotate in the cylindrical hole 58, as in the embodiment shown in Figure 1.

Paragraph on Page 6, Lines 21-23

In this case, a ball joint function is added to the junction device by which the suspended structure 36 is connected to the load bearing structure [[54]] 54'.

Paragraph on Page 6, Lines 24 to Page 7, Lines 1-4

More precisely, each of the disk shaped parts [[50]] 50' installed in the plates [[70]] 71 of the suspended structure 36 has a peripheral surface 72 in the form of a portion of a sphere. Intermediate parts 74 forming ball joint cages are installed in each of the plates [[70]] 71, to define internal surfaces 56' in the form of portions of spheres. These internal surfaces are complementary to peripheral surfaces 72 of disk shaped parts [[50]] 50' and have a common center of rotation. Thus, when these disk-shaped parts [[50]] 50' fit into intermediate parts 74, they form a ball joint type connection between the hinge pin [[48]] 48' and the suspended structure 36.

Paragraph on Page 7, Lines 5-11

Similarly, the disk shaped part [[52]] 52' has an external peripheral surface 76 in the form of a portion of a sphere, complementary to an internal surface 58' of the load bearing structure [[54]] 54' in the form of a portion of a sphere. Thus, when the disk shaped part [[52]] 52' fits into the load bearing structure [[54]] 54', the complementary surfaces 76 and 58' connect the hinge pin 48 and the load bearing structure [[54]] 54' through a ball joint type connection.
